Shutting down the Running Game by Limiting Steal Attempts
By David W. Smith
Presented June 29, 2012 at SABR42, Minneapolis, Minnesota
Stolen bases and caught stealing comprise a special place in the official records of baseball because they are the result of direct, willful action on the part of the offensive team. This is also true for the sacrifice bunt. No other offensive categories are intentional in this way. There has also been lively debate in the Sabermetric community about the precise value of a successful steal in terms of runs scored and conversely the amount of harm done harm done by being caught stealing. Perhaps the most interesting calculation is not the actual value of the steal, but rather the "break-even" point at which the reward of a steal equals the damage of the caught stealing. Various values have been calculated or modeled for breaking even and while there is a range, the strong consensus is that this balance occurs at around $2 / 3$ success, meaning that a team needs to have more than two steals for each caught stealing in order to benefit from the attempts.

Furthermore, many analysts have noted that the value of a stolen base is highly contingent on the context in which it occurs. Examples of these factors are:

Inning
Number of outs
Score differential
Era (deadball vs rabbit ball)
Normalized frequency of attempts
The present study was undertaken to address these contingency factors, with the focus on the frequency of attempts more than on the percentage of success.

Of course, play by play data are essential for this analysis and the files of Retrosheet were used. Table 1 has the summary of the games included in this study.

Table 1. Number of games examined:

| $1947-2011$ | 121438 | $98.8 \%$ |  |
| :--- | ---: | :--- | :--- |
| $1947-1950$ | 3457 | $69.7 \%$ |  |
| $1951-2011$ | 117981 | $100 \%$ | (includes 813 deduced games from 1951-1973) |

I decided to begin with a broad background summary of the 1947-2011 era. Figure 1 shows the total number of stolen bases per team per game. The three lines are for each league separately and then for the overall total (for all figures where leagues are presented separately, the NL will be in green, the AL in red and the combined totals in black). The range is remarkable from a low of 0.22 for the 1950 AL to a high of 0.95 for the NL in 1980 and 1986. There was an unexpected (by me at any rate) separation between the two leagues from 1980 through 1991with the NL averaging $19 \%$ more steals of second than the AL. Just as strange as the appearance of this
difference is its ending in 1992, with the two leagues very similar ever since. Both showed a decline from 1992 to the low point in 2003 and there has been a slight recovery since then. By the way, for the interleague era, which began in 1997, I checked to see if it mattered whether I identified league on the basis of where the game was played or by the normal league affiliation of the offensive team. Figure one was done on the basis of game location and the results were indistinguishable if I looked at the team's affiliation. I decided to report everything on the basis of game location just in case there was some difference that arose from using the DH or not.

As we all know, there are three different bases which can be stolen and Table 2 has the rates for each base.

Table 2. Percent of steals for each base:

|  | $2^{\text {nd }}$ | $3^{\text {rd }}$ | Home |
| :--- | :--- | :--- | :--- |
| AL | 88.1 | 10.9 | 0.9 |
| NL | 88.2 | 10.9 | 0.8 |
| Total | 88.2 | 10.9 | 0.8 |

Given the big differences between the leagues shown in Figure 1, these nearly identical values are a bit surprising. I checked on a yearly basis and found the percentage of steals that were of second and of third were not stable, as shown in Figures 2 and 3.

There is a great deal of variation over the 65 seasons, but once again something special happened between 1980 and 1991, although this time the leagues are virtually the same. For the last 20 years, the values have been pretty stable at around $87 \%$ for second base and $13 \%$ for third. Again, I see no obvious reason for the mirror image changes during the 1980s, nor for the end of those changes to the current stability.

In order to simplify the study I decided to concentrate on steals of second, which is reasonable given the overwhelming majority of the steal events that they represent. The last step in the general overview was to calculate the percentage of success for attempts to steal second. Figure 4 presents those results along with a horizontal line at $67 \%$ success, the generally accepted "break-even" point as noted above. It is interesting that for the majority of these 65 seasons, stolen base success was below this threshold, often well below it, with only the last 15 or so seasons exceeding that mark.

My biggest interest in this study is in rates of attempting to steal and to see the extent to which individual pitchers and catchers influence how often runners even make the attempt. I therefore had to define carefully exactly what an opportunity is. I came up with three categories, as shown in Table 3.

Table 3. Categories of opportunity to steal second.
Runner on first only
Runners on first and third
Runners on first and second and perhaps third
For the latter category a steal of second must be part of a double or triple steal attempt.

How often do these three types of situation occur? Table 4 has that information.
Table 4. Occurrence of each type of opportunity to steal second
Total plate appearances in games studied: 9,313,249
Total times a runner on first 3,076,463
Runner on first only 1,877,627
Runners on first and third 307,156
Runners on first and second or bases loaded 891,680

A different way of expressing these values, note that over the 121,438 games examined, there were 12.7 times per team per game that there was a runner on first. The average number of hits plus walks plus hit by pitch per team is 12.6.

How often was a steal of second attempted in each of the four situations? That is shown in Table 5 along with the percentage of success.

Table 5. Frequency of attempt to steal second for each category, expressed as percentage of opportunities, along with percentage of successful attempts

Percent attempted
All times runner on first
First only
First and third
First and second or loaded
6.15
8.95
5.24
0.56

Percent successful
67.0
64.4
88.6
89.5

As a further simplification, I decided to focus on the cases with a runner on first alone, since this was the most common situation with a runner on first and was clearly the one in which steals were attempted the most often. Figure 5 shows how the 8.95 \% average fit into the annual pattern from 1947 to 2011.

The basic pattern is what was seen for all steals in figure 1 with values ranging from $3.6 \%$ to $15.2 \%$. The difference between the two leagues in the 1980s is still prominent and at this point in the analysis rather expected if unexplained. The current rate is very close to the 65 -year average.

I usually stay away from focusing on individuals since the smaller data sets can lead to so much more variation. However, one of the premises of this study is that the identities of the runner, pitcher and catcher may affect how often steal attempts occur. Table 6 lists the 15 pitchers from 1947-2011 who faced the most situations with a runner on first only. For the analysis of pitchers and catchers, I included pickoffs along with the caught stealing since that is certainly within the idea of shutting down the running game. See appendix at end for list of leaders.

Table 6. Pitchers facing most situations of runner on first only

| Name | Opps | SB | CS | \%try | \%success |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Nolan Ryan | 4543 | 630 | 232 | 19.0 | 73.1 |
| Gaylord Perry | 4404 | 189 | 199 | 8.8 | 48.7 |
| Steve Carlton | 4349 | 209 | 221 | 9.9 | 48.6 |
| Phil Niekro | 4332 | 334 | 226 | 12.9 | 59.6 |
| Warren Spahn | 4140 | 50 | 117 | 4.0 | 29.9 |
| Don Sutton | 4133 | 357 | 126 | 11.7 | 73.9 |
| Bert Blyleven | 4098 | 352 | 162 | 12.5 | 68.5 |
| Tommy John | 4028 | 163 | 124 | 7.1 | 56.8 |
| Roger Clemens | 3931 | 364 | 196 | 14.2 | 65.0 |
| Jim Kaat | 3856 | 109 | 78 | 4.8 | 58.3 |
| Greg Maddux | 3749 | 430 | 150 | 15.5 | 74.1 |
| Tom Seaver | 3676 | 350 | 154 | 13.7 | 69.4 |
| Tom Glavine | 3660 | 170 | 140 | 8.5 | 54.8 |
| Robin Roberts | 3581 | 158 | 80 | 6.6 | 66.4 |
| Frank Tanana | 3508 | 191 | 167 | 10.2 | 53.4 |

Nolan Ryan and Greg Maddux were well known for being "easy to run on" and in fact we see that runners not only tried to steal much more against them than the average, they were also incredibly successful with nearly 75\% making it to second. Don Sutton's numbers were very similar. On the other hand, Warren Spahn was famous for intimidating runners and in fact only $4.0 \%$ of the time did a runner try to steal against him, and their success rate was an appalling 29.9\%.

I then sorted the pitcher list for the highest percentage of steal attempts for all pitchers facing first base only situations at least 500 times. As shown in Table 7, there were 10 pitchers who saw runners attempt to steal at least $18 \%$ of the time; the percentage of runner success is also shown.

Table 7. Highest \% of attempts allowed by pitchers with 500 opportunities

| Name | Opps | SB | CS | \%try | \%success |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Steve Mura | 555 | 87 | 28 | 20.7 | 75.7 |
| David Palmer | 929 | 139 | 53 | 20.7 | 72.4 |
| Mike Scott | 1600 | 240 | 88 | 20.5 | 73.2 |
| Dwight Gooden | 2359 | 343 | 128 | 20.0 | 72.8 |
| Ed Halicki | 836 | 140 | 25 | 19.7 | 84.8 |
| Charlie Puleo | 597 | 84 | 32 | 19.4 | 72.4 |
| Nolan Ryan | 4543 | 630 | 232 | 19.0 | 73.1 |
| Chris Young | 619 | 101 | 15 | 18.7 | 87.1 |
| Hideo Nomo | 1603 | 219 | 77 | 18.5 | 74.0 |
| Mario Soto | 1340 | 176 | 71 | 18.4 | 71.3 |

Some of these names are not a surprise. For example, Gooden and Nomo had big motions and were slow to the plate. Chris Young, who is 6 feet, 10 inches tall, has an extremely slow delivery. It is not at all surprising that runners are very successful against this group since presumably their increased percentage of running reflects their perception of increased chance of success.

Table 8 presents the counterpart, namely pitchers who allowed steal attempts rarely.

| Table 8. Pitchers allowing fewest steal attempts |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | Opps | SB | CS | \%try | \%success |
| Name | 683 | 13 | 6 | 2.8 | 68.4 |
| Lou Brissie | 532 | 5 | 11 | 3.0 | 31.3 |
| Scott Downs | 667 | 9 | 12 | 3.1 | 42.9 |
| Ted Bowsfield | 603 | 7 | 12 | 3.2 | 36.8 |
| Monty Kennedy | 504 | 6 | 10 | 3.2 | 37.5 |
| Luis Arroyo | 1412 | 15 | 31 | 3.3 | 32.6 |
| Bob Porterfield | 613 | 7 | 13 | 3.3 | 35.0 |
| Shietoshi Hasegawa | 728 | 15 | 10 | 3.4 | 60.0 |
| Al Brazle | 1506 | 29 | 23 | 3.5 | 55.8 |
| Mel Parnell | 750 | 13 | 13 | 3.5 | 50.0 |
| Frank Baumann |  |  |  |  |  |

As expected, these extremely low attempt frequencies are generally associated with low rates of success once again indicating that runners are paying attention to who is pitching, but this is more variable than in the previous table. Almost all of these pitchers are from the early years of the study and it is notable that all are in the low end of opportunities.

How about catchers? It used to be that steals were largely seen as the catcher's responsibility for good or ill, although I hear announcers these days being very likely to focus on pitchers first. Tables 9, 10 and 11 have data for catchers corresponding to the three table for pitchers, with the threshold for opportunities raised to 1000.

| Table 9. Catchers facing most situations of runner on first only |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  |  |  |  |  |  |
| Name | Opps | SB | CS | \%try | \%success |
| lvan Rodriguez | 17626 | 589 | 507 | 6.2 | 53.7 |
| Carlton Fisk | 15818 | 1036 | 510 | 9.8 | 67.0 |
| Bob Boone | 15808 | 886 | 591 | 9.3 | 60.0 |
| Jason Kendall | 14927 | 884 | 334 | 8.2 | 72.6 |
| Gary Carter | 14304 | 1196 | 663 | 13.0 | 64.3 |
| Jim Sundberg | 13667 | 794 | 561 | 9.9 | 58.6 |
| Benito Santiago | 13645 | 759 | 411 | 8.6 | 64.9 |
| Brad Ausmus | 13136 | 675 | 329 | 7.6 | 67.2 |
| Lance Parrish | 13122 | 775 | 511 | 9.8 | 60.3 |
| Tony Pena | 12888 | 946 | 520 | 11.4 | 64.5 |
| Ted Simmons | 12883 | 901 | 479 | 10.7 | 65.3 |
| Yogi Berra | 12671 | 290 | 328 | 4.9 | 46.9 |
| Johnny Bench | 12173 | 516 | 389 | 7.4 | 57.0 |
| Bill Freehan | 11648 | 571 | 332 | 7.8 | 63.2 |
| Mike Piazza | 11055 | 1020 | 289 | 11.8 | 77.9 |

There is the usual wide variation in attempts against with Yogi Berra and Ivan Rodriguez leading the way in discouraging runners. The percentage success is below the break-even point for all except Jason Kendall. It is to be expected that these men who caught so much would be good at throwing out would-be base stealers.

Table 10 shows the catchers who allowed steal attempts at the highest rates.
Table 10. Catchers with highest percentage of attempts allowed

| Name | Opps | SB | CS | \%try | \%success |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Keith Moreland | 1012 | 140 | 40 | 17.8 | 77.8 |
| Mackey Sasser | 1463 | 168 | 64 | 15.9 | 72.4 |
| Mike Fitzgerald | 4720 | 564 | 163 | 15.4 | 77.6 |
| Bruch Bochy | 1648 | 176 | 74 | 15.2 | 70.4 |
| Tim Blackwell | 2495 | 250 | 122 | 14.9 | 67.2 |
| Biff Pocoroba | 2658 | 280 | 108 | 14.6 | 72.2 |
| Craig Biggio | 2905 | 320 | 96 | 14.3 | 76.9 |
| John Russell | 1247 | 135 | 43 | 14.3 | 75.8 |
| Ozzie Virgil | 4658 | 491 | 170 | 14.2 | 74.3 |
| Dann Bilardello | 2088 | 191 | 105 | 14.2 | 64.5 |
| Luis Pujols | 1811 | 205 | 51 | 14.1 | 80.1 |
| Bob Brenly | 4407 | 399 | 219 | 14.0 | 64.6 |
| Nelson Santovenia | 1676 | 163 | 71 | 14.0 | 69.7 |

It is no surprise that these catchers who allowed the most attempts also allowed the most success, with all of them except Bob Brenly at or above the $2 / 3$ break-even point.

Finally, Table 11 presents the catchers against whom runners tried the least often.
Table 11. Catchers with lowest percentage of attempts allowed

| Name | Opps | SB | CS | \%try | \%success |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Roy Campanella | 8878 | 141 | 211 | 4.0 | 40.1 |
| Bill Sarni | 2588 | 45 | 60 | 4.1 | 42.9 |
| Bob Swift | 1652 | 33 | 36 | 4.2 | 47.8 |
| Aaron Robinson | 2260 | 46 | 54 | 4.4 | 46.0 |
| Birdie Tebbetts | 3319 | 78 | 71 | 4.5 | 52.3 |
| Del Rice | 6691 | 167 | 137 | 4.5 | 54.9 |
| Wes Westrum | 5282 | 100 | 141 | 4.6 | 41.5 |
| Joe Pignatano | 1791 | 41 | 41 | 4.6 | 50.0 |
| Del Wilber | 1222 | 28 | 28 | 4.6 | 50.0 |
| Mickey Grasso | 2246 | 47 | 56 | 4.6 | 45.6 |
| Jim Hegan | 10400 | 215 | 263 | 4.6 | 45.0 |

This is a remarkable list with the majority of these catchers throwing out more runners than succeeded! All of them allowed successful steals at much less than the break-even point. As expected, runners learned not to try very often.

The final aspect to consider is the attempt frequencies of different runners. I began by looking at the leading base stealers and set the limit of 300 steals of second. There were 76 runners with at least that many steals from 1947 to 2011. The first part of their activity is summarized in Table 12.

Table 12. Steal opportunities and attempts by leading base stealers, minimum 300 steals of second.

$$
\text { \% of opps \% of attempts } \% \text { of SB }
$$

| AL | 6.3 | 16.8 | 19.9 |
| :--- | :--- | :--- | :--- |
| NL | 8.6 | 22.2 | 25.3 |
| Total | 7.4 | 19.6 | 22.7 |

Table 13 continues the analysis of these prolific stealers with data on how often they attempted and were successful.

Table 13. Frequency of steal attempts and success for leading base stealers as compared to others Minimum of 300 steals

|  | \%try | \%success |
| :--- | ---: | ---: |
| AL | 23.0 | 74.8 |
| NL | 24.4 | 74.5 |
| Total | 23.8 | 74.6 |

Fewer than 300 steals

| AL | 7.6 | 61.1 |
| :--- | :--- | :--- |
| NL | 8.0 | 62.8 |
| Total | 7.8 | 61.9 |

Therefore, the elite baserunners attempted to steal second over three times as often as others and they succeed much more often. It appears that the runners who attempt a lot of steals are the right ones to be doing it.

Individual baserunners show enormous variation, as would be expected. Table 14 presents the data for the 10 runners with the highest percentage of attempts in a single season, with a minimum of 150 opportunities.

| Table 14. Highest \% of attempts in single season. |  |  |  |  |  |  |  |
| :--- | ---: | :--- | ---: | ---: | ---: | ---: | :---: |
|  |  |  |  |  |  |  |  |
| Name | Year | Ops | SB | CS | \%try | \%success |  |
| Lou Brock | 1974 | 179 | 105 | 28 | 74.3 | 78.9 |  |
| Rickey Henderson | 1982 | 172 | 80 | 26 | 61.6 | 75.5 |  |
| Maury Wills | 1965 | 169 | 71 | 27 | 58.0 | 72.4 |  |
| Vince Coleman | 1985 | 161 | 69 | 20 | 55.3 | 77.5 |  |
| Willie Wilson | 1979 | 152 | 71 | 11 | 53.9 | 86.6 |  |
| Rickey Henderson | 1983 | 154 | 69 | 14 | 53.9 | 83.1 |  |
| Dave Collins | 1980 | 153 | 66 | 14 | 52.3 | 82.5 |  |
| Tim Raines | 1983 | 182 | 82 | 12 | 51.6 | 87.2 |  |
| Omar Moreno | 1979 | 158 | 62 | 17 | 50.0 | 78.5 |  |
|  |  |  |  |  |  |  |  |

As expected (and hoped for!), these runners who attempt a steal the most often are successful a very high percentage of the time.

I would like to return to the big differences we saw between the leagues from 1980 to 1991 in the rate at which steals were attempted. I hypothesized that this difference is accounted for by the
happenstance of where the leading stealers happened to play. I examined all runners who totaled at least 300 steals over this 12 year period and the results are in Table 15.

Table 15. Percentage attempts by leading stealers, 1980-1991, apportioned by league

| Name | Teams | AL | NL | Total |
| :--- | :--- | ---: | ---: | ---: |
| Rickey Henderson | OAK, NYA | 961 |  | 961 |
| Tim Raines | MON, CHA | 51 | 632 | 683 |
| Vince Coleman | SLN, NYN |  | 586 | 586 |
| Willie Wilson | KCA, OAK | 495 |  | 495 |
| Ozzie Smith | SDN, SLN | 117 | 290 | 407 |
| Steve Sax | LAN,NYA | 164 | 232 | 396 |
| Brett Butler | ATL, CLE, SFN, LAN | 75 | 275 | 350 |
| Lonnie Smith | PHI, SLN, KCA, ATL |  | 341 | 341 |
| Juan Samuel | PHI, NYN, LAN | 46 |  | 340 |
| Gary Pettis | CAL, DET, TEX | 218 |  | 327 |
| Mookie Wilson | NYN, TOR | 78 | 229 | 307 |
| Paul Molitor | MIL | 2645 | 3297 | 5942 |
| Gary Redus | CIN, PHI, CHA, PIT |  |  |  |
|  | Total | 15.3 | 16.2 |  |
|  | \% of league total | 7 | 8.8 | 15.8 |

The leading base stealers in terms of total steals clearly were in the NL in these years. Do these runners account for the big difference between the two leagues? These 12 men accounted for 652 more NL steals, but the actual difference between the two leagues for these 12 years was 2512, or nearly four times as many. Therefore, the difference is not just the activities of a few runners who attempt to steal very often, but it must be a more general league differential that persisted for over a decade and then disappeared.

At the start, I identified several different factors that might be relevant to a runner's choosing to steal and I would like to close by covering three of them very briefly. Table 16 shows the effect of the number of outs.

Table 16. Steal attempts in relation to number of outs.

| Outs | Opps | \%try | \%success |
| ---: | :---: | ---: | ---: |
| 0 | 287934 | 8.52 | 64.1 |
| 1 | 332642 | 9.29 | 62.0 |
| 2 | 334740 | 9.00 | 67.2 |

The frequency of attempts is a bit lower with no outs, but percentage of success is highest with 2 outs. Perhaps teams are reluctant to run early in the inning while trying to conserve outs and maybe the defense is a little less attentive when there are already two gone.

Table 17 shows the effect of the inning. I divided plays into three inning categories: 1-3, 4-6 and $7^{\text {th }}$ or later, including extra innings.

| Table 17. Steal attempts in relation to inning |  |  |  |  |
| :--- | :--- | ---: | ---: | :---: |
|  |  |  |  |  |
| Inning | Opps | \%try | \%succeed |  |
| $1-3$ | 322,480 | 11.16 | 64.2 |  |
| $4-6$ | 426,868 | 8.33 | 63.3 |  |
| 7-later | 205,968 | 6.83 | 67.6 |  |

Interestingly, the highest attempt rate occurs in the middle three innings although this category has the fewest opportunities. The success rate shows no relation to the inning.

Finally, table 18 addresses the score differential

| Table 18. Steal attempts in relation to score differential |  |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |
| Differential | Opps | \%try | \%success |  |  |  |  |
| $<-3$ | 228,012 | 2.12 | 83.0 |  |  |  |  |
| -3 to 3 | $1,484,226$ | 10.15 | 63.7 |  |  |  |  |
| $>3$ | 198,394 | 7.47 | 66.2 |  |  |  |  |

It is not surprising that the majority of opportunities occur in the middle score range, but it is also true that runners are more likely to run in those situations as well. The striking number in this table is the high percentage of success for runners who attempt to steal when they are far behind. Perhaps these are such surprises that the defense was not paying much attention to them. Note that runners attempt a steal much more often when they are ahead by 4 or more runs. Although the percentage success is not exceptional, being very close to the break-even point, I was surprised that there were so many attempts in light of the anger that steals in these situations often draw from the defense.

Other factors that were not examined were home vs road team, handedness of pitcher and handedness of batter when runner has steal opportunity. There are also multiple ways in which all of the identified factors may interact, but this study focused on them individually.

## Conclusions

- Frequency of steal attempts has varied greatly from 1947 to 2011
- Overall success at stealing has only been above the break-even point for last 15 years
- Runners are more successful against pitchers who allow many attempts and much less successful against pitchers who allow few attempts
- Catchers show similar patterns to pitchers, but less extreme
- Runners with many steals attempt more often and succeed more often
- Large, unexplained difference between AL and NL from 1980 to 1991
- Number of outs, inning and score differential show expected effects

As a final note to provide more context, I enclose the figure below which shows stolen bases per team per game for 1901-2011. Clearly there was a very different philosophy in the early part of the $20^{\text {th }}$ century.

Appendix. Pitchers and catchers with most pickoffs from 1947-2011

| Pitchers | Opps | Pickoff |
| :--- | ---: | ---: |
| Steve Carlton | 4349 | 135 |
| Andy Pettitte | 2627 | 91 |
| Mark Buehrle | 2090 | 83 |
| Jerry Koosman | 3313 | 77 |
| Kenny Rogers | 2824 | 76 |
| Mark Langston | 2679 | 68 |
| Warren Spahn | 4140 | 67 |
| Charlie Hough | 3043 | 66 |
| Wilbur Wood | 2303 | 61 |
| Fernando Valenzuela | 2484 | 58 |

| Catchers | Opps | Pickoff |
| :--- | ---: | ---: |
| Ivan Rodriguez | 17626 | 48 |
| Yadier Molina | 6203 | 38 |
| Jim Sundberg | 13667 | 32 |
| Johnny Bench | 12173 | 25 |
| Tony Pena | 12888 | 25 |
| Steve Yeager | 7818 | 24 |
| Benito Santiago | 13645 | 22 |
| Bob Boone | 15808 | 21 |
| Jose Molina | 3924 | 18 |
| Sammy White | 7662 | 18 |
