

Win Values:

Reintroducing a New Method of Evaluating Starting Pitchers

Rob Wood

Updated June 2018

Introduction

In 2002 I introduced a new methodology to evaluate pitchers. Here I would like to re-introduce the method to a new audience and present the results for the 2003-2017 seasons as well as more than thirty additional seasons (1939-1973) not previously published.

Win Values is a system to evaluate the contribution a starting pitcher makes to his team. Let me contrast my approach to the approach reflected in a pitcher's Wins Above Average (WAA) figure. WAA looks at a pitcher's ERA for a season and the number of innings he pitched, and together with information on the pitcher's home park estimates the number of runs that the pitcher saved his team over and above what a league average pitcher would have allowed. The final step of converting these saved runs into a number of wins is done by estimating how many additional runs, on average, lead to an additional team win.

WAA is a very compelling stat and has been the backbone of pitcher evaluations for many years. My system takes into account two additional factors in evaluating a starting pitcher. First, I evaluate a starting pitcher's contributions on a game-by-game basis rather than simply evaluating his end-of-season stats. After all, any average such as ERA can obscure as well as reveal information. A team for whom the starting pitcher gives up 0, 1, and 17 runs in three starts is likely to win more games than if the pitcher gives up 6 runs in each game, even though the average runs allowed is the same in the two cases. I am sure that readers will have heard the fable about the man with one foot in boiling water and the other foot in ice cold water who is certainly in agony but quite comfortable "on average".

Evaluation schemes for hitters are almost always performed using seasonal data rather than game-by-game (play-by-play) data. The reason is that hitters come up to bat 600-700 times over the course of a season. This represents a large enough sample for things to "even out" over the course of the season. Evaluations of hitters based upon seasonal stats are quite consistent with more detailed evaluations based upon play-by-play data. Therefore, it is typically not worth the extra effort to utilize more detailed evaluation methods for hitters.

Pitchers, on the other hand, start only about 30 games a season in today's era. Thirty games is not enough for things to "even out" over the course of a season. It turns out that the evaluation of pitchers using game-by-game data can often be significantly different than the evaluation using seasonal data.

Performing the evaluation on a game-by-game basis requires a great deal of detailed data as well as an entirely new set of machinery. The rules of thumb that apply to seasonal averages (such as the number of runs needed for an additional team win) no longer apply on a game-by-game basis. In addition, depending upon what elements of the game you include in the evaluation, probabilities may need to enter the fray.

For example, if a starting pitcher gives up 3 runs in a nine-inning game, how should we evaluate this outing? There are several possible approaches to answer this question. One approach would be to abstract from his team's actual offensive run support in the game and estimate his team's chance of winning using a league-wide distribution of runs scored for the offensive side of the ledger. This is essentially what Michael Wolverton does in his support-neutral wins methodology.

Alternatively, the current system of assigning wins and losses compares the number of runs the pitcher allowed versus the number of runs his team scored in support. Of course, he is assigned a win if his team scores more runs than he allowed, and a loss if vice versa.

These two approaches are a bit problematic if the pitcher did not pitch a complete game. Suppose a starting pitcher gave up 4 runs in 6 innings. Then calculating support-neutral wins or assigning a win or loss is a bit more complex.

My Win Values system explicitly takes into account how many runs the pitcher's own team actually scored in the game. Clearly WAA or support-neutral wins do not take into account a pitcher's run support. Those systems purposefully abstract run support so as to evaluate a pitcher solely on what he has control over.

While this sentiment is laudable, it does not necessarily lead to the most accurate evaluation of a pitcher's actual contribution to his team's actual winning of baseball games. A few examples may suffice. A pitcher who gives up only 2 runs in a 3-2 win surely contributed significantly more to his team winning the game than a pitcher who gives up only 1 run in a 13-1 win. In the first game, the team that scored only three runs could easily have lost the game with another pitcher on the mound that day. In the second game, the team that scored 13 runs would very likely have won the game with virtually any other pitcher on the mound that day.

Consider the flip side. Suppose a team loses a game 12-0. The starting pitcher should not shoulder a large portion of the blame for losing the game, despite giving up twelve runs. Even with a league-average pitcher on the mound that day (say allowing 4-5 runs), the team would not have come close to winning since it did not manage to score any runs at all.

I have designed Win Values to be the best system of evaluating a starting pitcher's contribution to his team actually winning games. Win Values integrates the pertinent information about the pitcher's performance (how many runs he allowed in how many innings) with the number of runs his team scored that day (how many runs they scored in those same number of innings).

WAA is a better measure of "how well" a pitcher pitched over the course of the season. On the other hand, my new Win Values is a better measure of "how valuable" a pitcher pitched over the course of the season.

Conceptual Framework

Win Values is a system that evaluates a pitcher's runs allowed in a game in light of his team's offensive run support in the game. Let me expositonally proceed first with an extreme view to "fix" the team's run support in the game (RS) and perform a pair of operations. The first operation would be merely to see how many runs the pitcher in question allowed in the game (RA), and then see if $RA < RS$ (i.e., whether the starting pitcher's team won or lost the game). The second operation would be replace the pitcher in question with league-average pitching, and see how often the team would win or lose. The

second operation brings in probabilities since we would need to consider the probability that league-average pitching would allow 0 runs, 1 run, 2 runs, ..., 25 runs.

Under this preliminary extreme view, the pitcher's win contribution would be reflected in the difference between his team's actual won or loss (depending upon if $RA < RS$ or $RA > RS$) and the probability that the team would have won the game with league-average pitching.

For illustrative purposes, suppose that the pitcher pitched a complete game and gave up 2 runs while his team scored 4 runs. Of course his team won the game. Suppose we find that league-average pitching would give up 3 or fewer runs 35% of the time. Then we could say that the pitcher's contribution to his team winning that game is 0.65 wins since his pitching turned a situation in which it was 35% likely to result in a win into a 100% win situation (ignoring ties for the moment).

The astute reader will likely have several questions at this point. What about hypothetical tie games? What if the pitcher did not pitch a complete game? What about the effect of the ballpark? Isn't fixing the team's offensive support too extreme? I will address these questions one by one.

Hypothetical tie games in which the league-average pitching gives up exactly the same number of runs as the team scored is easily handled. The simplest and most straightforward way to handle this situation is to say that the hypothetical game would go into extra innings, and that the team would have a 50% chance of winning the game.

How do we handle the case of a pitcher pitching less than a complete game? Suppose the pitcher pitches 7 innings and leaves the game with his team leading 4-2. Since the game is not yet over, we can't do the operation of simply seeing if the team actually won the game ($RA < RS$). Now there is more to it than that. Instead of a simple check to see if $RA < RS$, we need to modify the method to calculate the probability that a team leading 4-2 at the conclusion of the seventh inning will go on to win the game. This may be 80%, say. So even for the first of our two operations, we need to leave the realm of certainties and enter the realm of probabilities. Conceptually calculating these probabilities is not difficult; all it requires is tons of inning-by-inning run scored data.

The second operation of seeing how many runs league-average pitching would allow can also be modified to take into account the number of innings the starting pitcher in question pitched. In the above example, we would like to know the probability distribution of league-average pitching allowing any number of runs (say 0 to 25) through seven innings. We then bring in the probability machinery described above to assess the overall probability of the team winning the game with the score 4-X at the conclusion of the seventh inning, where X ranges from 0 to 25.

Incorporating the effect of the home ballpark is also conceptually straightforward. All that we would need is to calculate all of these probabilities in the context of the home ballpark. The probability of winning a game when scoring 4 runs is apt to be significantly higher if the game was played in the Astrodome than if it was played in Coor's Field.

One of the cornerstones of my new Win Values method is the fact that I explicitly take into account the run support a pitcher is provided in each game. However, I don't want to go overboard on this front. Here's an example why. Suppose a team wins a game 6-5. If I evaluate the starting pitcher's contribution by fixing his run support at exactly six runs, then any pitcher who gives up fewer than six runs will be deemed to have contributed the exact same amount to winning the game. This does not seem reasonable to me.

The question, then, is how within this framework to reflect the notion that a pitcher who wins a game 6-3, say, contributed more to his team win than a pitcher who wins a game 6-5.

My solution is to perform another operation. This one deals with the team's run support in the game. The reason that we feel that the 6-3 game pitcher was more valuable than the 6-5 game pitcher is because there was no guarantee that the team would actually score six runs in that game.

This notion is the kernel of the treatment of a pitcher's run support in the Win Values methodology. Rather than simply take the pitcher's run support as a given fixed entity, I seek a distribution of run support for that game.

Consider the following stylized example. Suppose a team is trailing 1-0 in the bottom of the ninth inning with two outs and a fast runner on first base. The next batter belts a long flyball that may be a home run, may hit off the wall scoring the runner from first base, or may be caught on the warning track. As the ball is flying through the air toward the seats, what are the possible run support figures the home team's starting pitcher may ultimately receive that day?

If the long fly becomes a home run, he will be provided two runs (and be a 2-1 winner). If the ball hits the wall, he will be provided one run (and the game will be tied). If the ball is caught on the warning track, he will be provided no runs (and be a hard-luck 1-0 loser). My idea of "could have been" run support levels attempts to capture these types of real-world possibilities.

I utilize backwards bayesian bootstrapping to derive the probability distribution of run support for each team in each game in a baseball season. The method relies upon bayesian inference and partial game scores. The idea is that a team that scores 7 runs in a game may well have scored 5 runs at the conclusion of the 6th inning. Of course, a team that scores a total of 4 runs in a game will never have scored 5 runs at the conclusion of the 6th inning. Thus, the number of runs that a team scores in partial games (say at the conclusion of the 6th inning) conveys information as to how many final runs it will ultimately score in the game.

Bayes Rule is the general principle that allows the inference to go in either direction so that knowing a game's final score can provide information on how many runs were likely to have scored at the conclusion of any particular inning. This provides the backbone of our notion of runs that "could have" scored since we can then bootstrap the run scoring process going forward again, say, starting at the top of the 7th inning.

This may be confusing, so I will give an example. Consider a team that scores 7 runs in a 9-inning game. Suppose I find that teams that score 7 runs in nine innings have scored 5 runs at the conclusion of the 6th inning 10% of the time. I also know the distribution of final scores of every game in which a team has scored exactly 5 runs at the conclusion of the 6th inning. Say these teams wind up scoring 5 runs in 9 innings 12% of the games, 6 runs 20% of the games, 7 runs 25% of the games, ..., and 15 runs 1% of the games.

I can calculate a bootstrapped distribution of final scores for every possible number of runs scored at the conclusion of the 6th inning. To find the ultimate "could have been" distribution of final scores, I would then weight these probability distributions of each possible runs scored outcome by the respective probability of having that many runs scored at the conclusion of the 6th inning (this was the 10% in the case of starting with 5 runs in the example above).

The result of this backwards bayesian bootstrapping is a “smearing” of the run support provided a pitcher in each game. For example, this method may find that a team that actually scored 7 runs in a nine-inning game “could have” scored runs with the following probabilities: 0 runs (1%), 1 run (2%), 2 runs (4%), 3 runs (6%), 4 runs (7%), 5 runs (9%), 6 runs (12%), 7 runs (15%), 8 runs (10%), 9 runs (8%), 10% (7%), 11 runs (6%), 12 runs (5%), 13 runs (4%), 14 runs (3%), and 15 runs (1%). The Win Values system uses this “could have been” smeared probability distribution for the pitcher's possible run support in the game in evaluating his outing.

To summarize, I am re-introducing the Win Values methodology to evaluate a starting pitcher's contribution to his team's chance of winning a game if the score is RS to RA at the conclusion of the Zth inning (the pitcher in question pitched Z innings and gave up RA runs – note that no distinction is made between earned and unearned runs). I will first “smear” the pitcher's run support based upon RS and Z using backward bayesian bootstrapping. That gives a probability distribution that the team could have scored X runs at the conclusion of the Zth inning where X ranges from 0 to 25, say.

Next, using the smeared run support distribution, I will estimate the probability that the team would win a game giving up RA runs at the conclusion of the Zth inning. This gives an estimate of the pitcher's win probability for the game.

I then use the exact same smeared run support distribution for the game compared to how many runs league-average pitching would allow to estimate the league-average win probability for the game. The difference between these two win probabilities is the pitcher's win contribution for that game.

Win Values are calculated in this manner for every starting pitcher for every game for every team in the entire season.

Retrosheet

My research, like much conducted in the modern era, is made possible by the wonderful folks at Retrosheet. The data I used was obtained free of charge from and is copyrighted by Retrosheet. It is impossible to fully thank the Retrosheet members for all they do.

Dave Smith and everyone connected with the organization have contributed (and continue to contribute) an amazing amount to baseball history and baseball research over the years. Retrosheet volunteers track down old game information, encode the information into digital form, create season and team files, develop download programs, maintain the fabulous website, and millions of other invaluable tasks undertaken by the Retrosheet team.

Recently, Retrosheet has undertaken the herculean task of deducing old games for which complete play-by-play information is not available. Dduced game files were created to fill the gap of missing games in seasons for which full play by play exists for the majority of games. It has been frustrating to be limited in analysis by this small group of missing games. Using contemporaneous newspaper reports, the play-by-play elements of each missing game were deduced such as hits, runs, and pitching changes (walks, strikeouts, and fielding plays are also deduced to the extent possible).

Retrosheet has recently released deduced files all the way back to 1939. Hence, my Win Value calculations which depend upon knowing inning-by-inning run-scoring and all pitching changes can now be performed for each league-season from 1939-2017. Again, I am very grateful to the Retrosheet team for making this information available and all support they provided me in this endeavor.

High Level Results

Here is a table of the Win Value League Leaders for each season from 1939-2017. The details of each season will be presented in a subsequent section below.

Year	AL Win Value Leader	Win Value (wins above avg)	NL Win Value Leader	Win Value (wins above avg)
2017	Corey Kluber	5.53	Clayton Kershaw	4.43
2016	Aaron Sanchez	3.91	Jon Lester	5.50
2015	Dallas Keuchel	4.83	Zack Greinke	7.24
2014	Corey Kluber	5.14	Clayton Kershaw	5.21
2013	James Shields	4.43	Clayton Kershaw	5.52
2012	Justin Verlander	4.34	Johnny Cueto	3.88
2011	Justin Verlander	5.64	Ian Kennedy	4.75
2010	Felix Hernandez	4.80	Ubaldo Jimenez	4.92
2009	Zack Greinke	6.25	Chris Carpenter	5.47
2008	Cliff Lee	5.62	Tim Lincecum	5.62
2007	Fausto Carmona	4.27	Brandon Webb	4.29
2006	Johan Santana	3.73	Chris Carpenter	4.41
2005	Johan Santana	4.74	Roger Clemens	6.29
2004	Johan Santana	5.67	Roger Clemens	4.34
2003	Esteban Loaiza	6.30	Jason Schmidt	5.23
2002	Tim Hudson	4.75	Randy Johnson	5.22
2001	Mike Mussina	4.27	Curt Schilling	6.25
2000	Pedro Martinez	8.02	Randy Johnson	5.40
1999	Pedro Martinez	7.22	Randy Johnson	6.19
1998	Roger Clemens	5.94	Greg Maddux	5.33
1997	Roger Clemens	8.22	Pedro Martinez	7.01
1996	Pat Hentgen	5.30	Kevin Brown	5.88
1995	Randy Johnson	6.34	Greg Maddux	8.43
1994	Roger Clemens	4.07	Greg Maddux	6.34
1993	Kevin Appier	5.91	Greg Maddux	5.10
1992	Mike Mussina	5.47	Greg Maddux	5.35
1991	Roger Clemens	4.77	Andy Benes	3.90
1990	Roger Clemens	7.38	Ed Whitson	3.28

Year	AL Win Value Leader	Win Value (wins above avg)	NL Win Value Leader	Win Value (wins above avg)
1989	Bret Saberhagen	5.81	Joe Magrane	4.09
1988	Frank Viola	5.46	Orel Hershiser	6.08
1987	Frank Viola	5.43	Rick Reuschel	3.80
1986	Roger Clemens	5.75	Mike Scott	5.15
1985	Bret Saberhagen	4.62	Dwight Gooden	8.63
1984	Dave Stieb	4.91	Dwight Gooden	4.64
1983	Richard Dotson	3.65	John Denny	3.95
1982	Dave Stieb	4.00	Steve Rogers	5.07
1981	Steve McCatty	2.98	Fernando Valenzuela	3.55
1980	Mike Norris	5.47	Steve Carlton	5.85
1979	Mike Flanagan	4.46	Joe Niekro	3.43
1978	Ron Guidry	6.83	Bob Knepper	3.95
1977	Jim Palmer	5.50	John Candelaria	6.43
1976	Mark Fidrych	5.95	Don Sutton	3.74
1975	Jim Palmer	7.12	Tom Seaver	4.73
1974	Gaylord Perry	5.30	Phil Niekro	4.71
1973	Jim Palmer	5.47	Tom Seaver	5.56
1972	Gaylord Perry	6.45	Steve Carlton	8.59
1971	Vida Blue	6.42	Tom Seaver	6.76
1970	Sam McDowell	4.77	Bob Gibson	4.19
1969	Denny McLain	5.56	Bob Gibson	6.60
1968	Luis Tiant	6.13	Bob Gibson	7.23
1967	Joe Horlen	3.51	Gary Nolan	3.97
1966	Jim Kaat	3.02	Sandy Koufax	7.13
1965	Sam McDowell	4.41	Sandy Koufax	7.37
1964	Dean Chance	7.17	Sandy Koufax	5.00
1963	Gary Peters	4.85	Dick Ellsworth	7.11
1962	Hank Aguirre	4.01	Bob Purkey	4.51
1961	Don Mossi	2.89	Joey Jay	3.94
1960	Jim Bunning	3.02	Bob Friend	3.64
1959	Hoyt Wilhelm	3.57	Vern Law	3.41
1958	Billy Pierce	3.25	Red Witt	3.85
1957	Jim Bunning	4.03	Johnny Podres	3.68

Year	AL Win Value Leader	Win Value (wins above avg)	NL Win Value Leader	Win Value (wins above avg)
1956	Herb Score	5.20	Don Newcombe	4.38
1955	Billy Pierce	4.25	Bob Rush	2.94
1954	Mike Garcia	3.72	Johnny Antonelli	5.47
1953	Billy Pierce	3.77	Warren Spahn	6.16
1952	Bobby Shantz	6.31	Ken Raffensberger	4.33
1951	Eddie Lopat	3.30	Sal Maglie	4.21
1950	Early Wynn	2.91	Robin Roberts	4.35
1949	Mel Parnell	5.82	Don Newcombe	4.30
1948	Hal Newhouser	4.33	Harry Brecheen	5.26
1947	Bob Feller	4.12	Ewell Blackwell	5.95
1946	Bob Feller	6.92	Harry Brecheen	3.62
1945	Hal Newhouser	6.15	Harry Brecheen	3.89
1944	Dizzy Trout	6.21	Bucky Walters	4.89
1943	Spud Chandler	5.69	Mort Cooper	4.92
1942	Tiny Bonham	3.98	Mort Cooper	6.17
1941	Thornton Lee	6.37	Whit Wyatt	5.66
1940	Bob Feller	6.89	Bucky Walters	4.64
1939	Bob Feller	5.84	Bucky Walters	6.64

Here is the the list of multiple Win Value league leaders from 1939-2017:

- | | |
|-------------------|--------------------|
| 8 Roger Clemens | 2 Bret Saberhagen |
| 5 Greg Maddux | 2 Chris Carpenter |
| 4 Bob Feller | 2 Corey Kluber |
| 4 Randy Johnson | 2 Dave Stieb |
| 3 Billy Pierce | 2 Don Newcombe |
| 3 Bob Gibson | 2 Dwight Gooden |
| 3 Bucky Walters | 2 Frank Viola |
| 3 Clayton Kershaw | 2 Gaylord Perry |
| 3 Harry Brecheen | 2 Hal Newhouser |
| 3 Jim Palmer | 2 Jim Bunning |
| 3 Johan Santana | 2 Justin Verlander |
| 3 Pedro Martinez | 2 Mike Mussina |
| 3 Sandy Koufax | 2 Mort Cooper |
| 3 Tom Seaver | 2 Sam McDowell |
| | 2 Steve Carlton |
| | 2 Zack Greinke |

Here is the list of the 100 best single season Win Values for starting pitchers between 1939-2017.

Rank	Year	League	Pitcher	Win Value (wins above avg)
1	1985	NL	Dwight Gooden	8.63
2	1972	NL	Steve Carlton	8.59
3	1995	NL	Greg Maddux	8.43
4	1997	AL	Roger Clemens	8.22
5	2000	AL	Pedro Martinez	8.02
6	1990	AL	Roger Clemens	7.38
7	1965	NL	Sandy Koufax	7.37
8	2015	NL	Zack Greinke	7.24
9	1968	NL	Bob Gibson	7.23
10	1999	AL	Pedro Martinez	7.22
11	1964	AL	Dean Chance	7.17
12	1966	NL	Sandy Koufax	7.13
13	1975	AL	Jim Palmer	7.12
14	1963	NL	Dick Ellsworth	7.11
15	1997	NL	Pedro Martinez	7.01
16	1946	AL	Bob Feller	6.92
17	1963	NL	Sandy Koufax	6.92
18	1940	AL	Bob Feller	6.89
19	1978	AL	Ron Guidry	6.83
20	1946	AL	Hal Newhouser	6.80

Rank	Year	League	Pitcher	Win Value (wins above avg)
98	1948	NL	Harry Brecheen	5.26
99	1992	AL	Roger Clemens	5.25
100	1939	AL	Bobo Newsom	5.23

Storied seasons take their rightful place atop the single-season Win Values leaderboard. Dwight Gooden in 1985, Steve Carlton in 1972, Greg Maddux in 1995, Roger Clemens in 1997, and Pedro Martinez in 2000 are the five most valuable seasons calculated to date. Sandy Koufax's fantastic 1965 season and Bob Gibson's immortal 1968 season also make the top ten.

It is an important finding that the vast majority of these pitchers' win value figures are less than their WAA figures (the traditional estimates of the pitchers' number of wins above average they contributed to their team using only seasonal stats) for their great seasons. Gooden in 1985 had a 9.8 WAA whereas he accrued "only" 8.63 win values. Carlton in 1972 had a 9.3 WAA whereas he accrued "only" 8.59 win values. Clemens in 1997 had a 9.4 WAA whereas he accrued "only" 8.22 win values. Finally, Pedro in 2000 had a 9.7 WAA whereas he accrued "only" 8.02 win values.

The reason that seasonal-based WAA overvalues great seasons is due to the non-linear nature of the relationship between preventing runs and winning games. If a team scores 6 runs, say, then the "win-factor" of allowing 5, 4, 3, 2, 1, and 0 runs will be highly non-linear. Essentially, these pitchers' great run prevention was overkill. Their teams would have won around the same number of games if they had given up a few more runs over the course of the season. Win Values is able to make this distinction whereas Wins Above Average is not.

Here is the list of the top 100 leaders in Total Win Values from 1939-2017.

Rank of Total Win Values (1939-2017)	Pitcher	Total Win Values (wins above avg; 1939-2017)	Pennants Added (1939-2017)	Rank of Pennants Added (1939-2017)

We see that the triumvirate of Roger Clemens, Greg Maddux, and Tom Seaver are top three in Total Win Values for the 1939-2017 era. Clemens is number one by a large margin. Recent Retrosheet releases have given us the prime of Bob Feller's career but we still lack his three teenage seasons. I am curious to learn how well Feller fares when his complete career is covered. (He checks in at 21st now.)

In addition to the career Win Values, I also present each pitcher's estimated pennants added figure over this time period as well. The idea of measuring a player's performance in terms of how many pennants he would add to his team has been around for a long time. Bill James wrote about it when he compared Don Drysdale to Milt Pappas in one of his books. (Joe Dimino has calculated pennant-added figures for many of the players appearing on Hall of Merit ballots over the years.) Drysdale and Pappas have similar career values yet Drysdale contributed to more pennants than Pappas since Drysdale had an appreciable higher peak. And it is a high peak that contributes to increased pennant chances.

I performed a series of simulations to attempt to estimate the non-linear relationship between a pitcher's wins above average (which Win Values reflect) and the additional chance his team has in winning the pennant that season. I assumed a conventional spread of underlying qualities of the teams in a league, and then simulated replacing a league-average pitcher with the pitcher in question by successively adding a specific number of wins to the team total for each team in the league.

Based upon these simulations, I estimated the relationship as follows:

$$\text{Pennant Added} = 0.03 * (\text{Win Values} ^ 1.25) \text{ if Win Values} > 1, \text{ or}$$

$$\text{Pennant Added} = 0.03 * \text{Win Values} \text{ if Win Values} \leq 1.$$

You will see in the table above that the ranking via Win Values occasionally diverges from the ranking via Pennants Added. The first such divergence concerns Mike Mussina and Curt Schilling. Mussina is ranked slightly ahead of Schilling on total win values, but Schilling leap-frogs Mussina in pennants added since Schilling's peak seasons are more pennant-boosting than Mussina's.

Since I want the focus of this article to be on Win Values, I will simply report the pennant added figures without further comment. This is undoubtedly a topic of future research.

Season-by-Season Results

Here are the top ten Win Values in each league from 1939-2017.

1939 AL Win Values

Rank	Pitcher	Win Value	W-L	IP	ERA+
1	Bob Feller	5.84	24-9	297	154
2	Bobo Newsom	5.23	20-11	292	136
3	Lefty Grove	4.76	15-4	191	185
4	Tommy Bridges	3.51	17-7	198	139
5	Red Ruffing	3.45	21-7	233	148
6	Johnny Rigney	3.41	15-8	219	129
7	Ted Lyons	3.10	14-6	173	173
8	Dutch (Emil) Leonard	2.46	20-8	269	121
9	Mel Harder	2.39	15-9	208	125
10	Lefty Gomez	2.11	12-8	198	128

1939 NL Win Values

Rank	Pitcher	Win Value	W-L	IP	ERA+
1	Bucky Walters	6.64	27-11	319	170
2	Paul Derringer	3.36	25-7	301	132

Win Values relative to Replacement Level

By construction, Win Values is a measurement of a pitcher's performance over and above league-average pitching. As such, several pitchers with meteoric but short careers appear on the top 100 career Win Values list. Also, several pitchers who pitched relatively few innings in a season have appeared on the seasonal top-ten Win Value leader tables.

Bill James argued many years ago that measuring performance relative to league average is using a standard that is too high. League-average players provide plenty of value to their teams. Think of the pyramidal distribution (the right end of a bell curve) of talent among professional baseball players. Major league league-average players are rare and valuable.

In many contexts measuring performance relative to a replacement-level is appropriate, where the replacement-level is the quality of performance that a major league team could be expected to receive from freely available talent (think good triple-A players). If a major league player performs consistently below this level, he will be replaced. On the other hand, if a major league player performs above this replacement-level, even if it is below the major league average level, he would typically not be replaced (and could well receive a hefty contract).

This may be especially true for pitchers as good major league pitchers seem always to be in short supply. Many pitchers have made good careers out of being “innings eaters” even if they rarely soar to the heights of above-average performance.

Replacement level is difficult to measure precisely. However, using the WAA and WAR figures from Baseball-Reference.com, I estimate that the difference between the two is around .075 per nine innings for a starting pitcher. So a league-average starting pitcher ($WAA=0.0$) who pitches 240 innings in a season would have a WAR of roughly 2.0.

Using the .075 figure, the following table displays each pitcher's total win values relative to replacement level alongside his previously displayed total win values relative to league average. Note that in the interests of brevity, I will not re-present all of the 1939-2017 seasonal top-ten lists of win value leaders relative to replacement level.

Here is a list of the top 100 pitchers according to total win values relative to replacement level from 1939-2017.

Rank of Total Win Values relative to Replacement Level (1939-2017)	Pitcher	Games Started (1939-2017)	Innings Pitched in Starts (1939-2017)	Avg Innings Pitched per Start (1939-2017)	Total Win Values (wins above average; 1939-2017)	Total Win Values (wins above replacement; 1939-2017)
1	Roger Clemens	707	4,914	6.95	82.37	123.32
2	Greg Maddux	740	5,001	6.76	65.23	106.91

Roger Clemens, Greg Maddux, and Tom Seaver are the top three starting pitchers in the 1939-2017 era in total win values relative to replacement level just as they were the top three in total win values relative to league average. However, there are some interesting differences in the rankings between the two tables.

Pedro Martinez comes in 12th in total win values relative to replacement due to his short career whereas he was 5th in total win values relative to league average performance.

Pitchers with very long careers who crack the top ten via this metric include Gaylord Perry (7th up from 13th), Nolan Ryan (8th up from 19th), Steve Carlton (9th up from 18th), and Bert Blyleven (10th up from 14th).

Remember that all figures displayed in this article are solely based upon games started. Several pitchers in the table above (as well as previous tables) also accrued significant value via relief appearances which is not reflected in these tables. This would include modern “two-way” pitchers such as John Smoltz and Dennis Eckersley, along with several pitchers from a bygone era in which starters were often called on to put out fires between their regular starting assignments.

You may notice that the above table does not display pennants added figures. There are two reasons for that. First, I have not yet performed simulations to derive estimates of the relationship between a pitcher's wins-above-replacement-level and his contribution to his team winning a pennant. Second, I

am somewhat hesitant to do so since I believe that it may be proper to only consider above league-average performance to actually helping a team win the pennant.

It would be strange to say that the below-average left-fielder, shortstop, or starting pitcher helped his team win the pennant. For now I will stick to the pennant-added figures presented previously (based upon measuring value relative to league-average).

Concluding Remarks

In this article I have re-introduced a new stat called Win Values that I developed to evaluate the contribution a starting pitcher makes to his team over the course of a season. Win Values are calculated on a game-by-game basis and take into account not only the number of runs the pitcher allowed but also the number of runs his own team scored. Only by considering both sides of the equation can we properly derive how valuable a pitcher's performance was in helping his team win the game.

A pitcher's win value figure is an estimate of how many wins he contributed to his team over the course of a season relative to league-average pitching. A pitcher who wins a game 3-2 is deemed to be more valuable than a pitcher who wins a game 13-1 since the team who won 3-2 was fairly likely to have lost the game scoring only 3 runs with league-average pitching whereas the team who won 13-1 was extremely likely to have won the game scoring 13 runs no matter who was pitching for them that day.

The very best Win Value seasons from 1939-2017 were presented. Dwight Gooden in 1985, Steve Carlton in 1972, Greg Maddux in 1995, Roger Clemens in 1997, and Pedro Martinez in 2000 are the five most valuable seasons calculated to date. Sandy Koufax's fantastic 1965 season and Bob Gibson's immortal 1968 season also make the top ten.

The most valuable starting pitchers appear at the top of the Total Win Values relative to league average listing from 1939-2017. The top five were Roger Clemens, Greg Maddux, Tom Seaver, Randy Johnson, and Pedro Martinez.

When value is measured relative to replacement level, the top five remains unchanged with the exception that Warren Spahn and his longevity replace Pedro Martinez in the top five.

Topics for future win value research are numerous. To name but one, currently the win value methodology essentially assumes league-average defense behind each pitcher in the league. Perhaps a way to allocate the run prevention credit between pitchers and fielders within the win value framework can be developed.

Finally, I would like once again to thank the wonderful folks at Retrosheet for all they have done in making historical data available to baseball fans and researchers alike. They have done an outstanding job in preparing complete seasons going all the way back to 1939 (with on-going efforts to continue pushing back the "frontier").

At the pace they are going, I hope that they are able to soon release other prior seasons. Of course, when additional seasons are released, I will be able to derive the Win Values for all starting pitchers appearing in those seasons. Accordingly, I look forward some day to deriving Win Values for all-time greats such as Walter Johnson, Lefty Grove, Pete Alexander, Christy Mathewson, and others.
